

USER STORIES

US-01 (BR-01)

As a **Warehouse Staff member**, I want the system to update inventory levels automatically when I scan a barcode during picking and packing, so that stock counts are always accurate in real-time.

Acceptance Criteria: *Given* a warehouse staff member scans a valid barcode during picking, *When* the scan is confirmed, *Then* the inventory level for that SKU must decrease by the scanned quantity within 3 seconds.

US-02 (BR-02)

As a **Procurement Lead**, I want to receive an automatic reorder alert when any item falls below its safety threshold, so that I can prevent stockouts before they impact operations.

Acceptance Criteria: *Given* an item's stock level drops below the defined safety threshold, *When* the system detects this change, *Then* an alert notification must be sent to the Procurement Lead within 60 seconds.

US-03 (BR-03)

As a **Logistics Manager**, I want a daily fulfillment dashboard showing pending, shipped, and delayed orders, so that I can prioritize and resolve delivery issues proactively.

Acceptance Criteria: *Given* the Logistics Manager logs in, *When* they open the dashboard, *Then* the system must display all orders categorized by status — pending, shipped, delayed — updated as of that day.

US-04 (BR-04)

As an **IT Admin**, I want the system to require secure login and enforce Role-Based Access Control, so that unauthorized users cannot access or manipulate inventory data.

Acceptance Criteria: *Given* a user attempts to log in, *When* they enter credentials, *Then* the system must authenticate via username/password and grant access only to features permitted for their assigned role.

US-05 (BR-05)

As a **Sales Team member**, I want to view live stock availability during order entry, so that I can prevent over-selling items that are out of stock.

Acceptance Criteria: *Given* a sales team member is creating an order, *When* they select a product, *Then* the system must display real-time available stock quantity before the order is confirmed.

US-06 (BR-06)

As an **Operations Head**, I want every manual stock adjustment to generate a digital audit trail with timestamp and user ID, so that all inventory changes are traceable and accountable.

Acceptance Criteria: *Given* any user makes a manual stock adjustment, *When* the adjustment is saved, *Then* the system must

automatically log the user ID, timestamp, and quantity changed — visible in the audit report.

US-07 (BR-07)

As a **Procurement Lead**, I want weekly Stock Turnover Reports identifying slow vs. fast-moving goods, so that I can make data-driven procurement decisions.

Acceptance Criteria: *Given* a week has passed, *When* the Procurement Lead accesses reports, *Then* the system must generate a Stock Turnover Report ranking items by movement rate for that week.

US-08 (BR-08)

As a **Warehouse Staff member**, I want to digitize incoming supplier shipments instantly through a Goods Receipt module, so that new stock is recorded without manual data entry delays.

Acceptance Criteria: *Given* a supplier shipment arrives, *When* the warehouse staff scans incoming items via the Goods Receipt module, *Then* the system must add the received quantities to inventory and generate a digital receipt record immediately.

US-09

As a **Warehouse Manager**, I want to view real-time inventory levels and daily operational activity across all bays, so that I can identify bottlenecks and ensure warehouse operations run efficiently.

Acceptance Criteria: *Given* the Warehouse Manager logs into the system, *When* they open the inventory overview, *Then* the system must

display current stock levels, pending picks, and completed transactions for the current shift.
